To Whomever It May Concern

This is to formally acknowledge that the NIBRA-CS® system has been used in our institution for Autonomic Neurofunction Testing, following due approval from the Institutional Ethics Committee.

NIBRA-CS® (Non-Invasive Baro Reflex Assessment - Combined System) is a non-invasive diagnostic tool designed to assess the autonomic nervous system's parasympathetic and sympathetic functions safely and effectively. Its user-friendly touchscreen interface and stand-alone design have made the testing process more straightforward and accessible for clinicians without compromising accuracy.

Through consistent clinical use, no risks or harm to patients have been observed. On the contrary, the system's ease of operation has facilitated smoother workflows and greater accessibility of autonomic testing, which is critically important for diagnosing and managing autonomic disorders.

This acknowledgement is issued for formal documentation and record purposes.
